

Relativistic analysis of an Earth-satellite time transfer

Olivier Minazzoli Bertrand Chauvineau

E-mail: olivier.minazzoli at obs-azur.fr

Analytical treatment of the time transfer problem for an "Earth-satellite" system is presented. The development was made in a complete relativistic framework. At a first level of accuracy relevant for low altitude orbits, we neglect the other bodies and consider only the $1/c^2$ Earth potential developed up to the J2 term in spherical harmonics.
